1. Medium of exchange

- Off the platform (e.g. Bitcoin)
- On the platform (e.g. Filecoin)
- 2. In addition to investors, users and developers have a demand for holding cryptocurrencies.
- 3. Underlying value depends on the network effect.
 - "You should look at community support and number of developers working on projects for a certain platform. There is no other project with network effects even close to ethereum."
 - "More developer activity and use cases = higher user adoption = more demand for req = higher req price"
 - "How many users can Coinbase onboard everyday? The more people that own 1 LTC, the faster the value grows."

1. Wide variation in the pairwise correlation of cryptocurrency returns

Intro 000●0000	Hypotheses and Data		Endogeneity 00000000	Network Effect	
Fmniri	cal Facts				

1. ... and this variation is persistent over time.

Empirical Facts

2. Wide variation in trading platforms of cryptocurrencies

-

Overview of Results

1. Cryptocurrencies with a similar investor base comove substantially more than currencies with different investors.

- a) One standard deviation higher "connectivity" is associated with approximately 0.2 standard deviations higher correlations.
- b) This effect cannot be explained by similarities in technological features or other characteristics.
- c) Exogenous changes in the investor base cause significant changes in comovement.

2. The <u>network effect</u> plays an important role in explaining the magnitude of the results.

- a) Exposure to similar investor bases translates into 40 to 50% additional comovement for currencies that heavily rely on the network externalities arising from user and developer participation.
- b) More network-based cryptocurrencies exhibit higher volatility.

- 2. The <u>network effect</u> plays an important role in explaining the magnitude of the results.

Main Testable Hypotheses

- 1. Cryptocurrencies with similar investor bases should exhibit strong comovement in returns and order imbalance beyond what can be explained by their characteristics and technology.
 - Exogenous changes in the investor base should cause changes in comovement.

2. This effect should be larger for cryptocurrencies that derive more value from the network effect because of the additional price impact of the common demand shocks.

Proxy for Exposure to Similar Investor Base

A pairwise *Connectivity* measure:

Connectivity_{*i*,*j*,*t*} =
$$1 - \frac{1}{2} \sum_{k=1}^{K} |p_{i,k,t} - p_{j,k,t}|$$

where

$$p_{i,k,t} = \frac{V_{i,k,t}}{\sum_{n=1}^{K} V_{i,n,t}}$$

What Drives the Covariation of Cryptocurrency Returns?

Connected Portfolio Returns

Summarizing the returns of all currencies connected to currency *i*:

$$R_{i,t}^{Con} = \sum_{j=1}^{N} w_{j,t} R_{j,t}$$

$$w_{j,t} = \frac{Connectivity_{i,j,t-1} Volume_{j,t-1}}{\sum_{n=1}^{N} Connectivity_{i,n,t-1} Volume_{n,t-1}}$$

Evidence from a Quasi-Natural Experiment

- The Chinese government shut down all Chinese crypto exchanges in September 2017.
- The shutdown created an exogenous shock to certain cryptocurrencies trading locations and, hence, to their connectivity.
- The shock can be used to construct an instrument for changes in connectivity.

Capturing Cross-Sectional Variation in the Network Effect

- Quantifying the extent that investors and community of different cryptocurrencies "believe" the currency's underlying value is derived from the network effect.
- Using 12 million currency-specific comments on Reddit to capture this variation:
 - 1. Reading and labeling 10,000 comments as a training sample.
 - 2. Using random forest to extract important features that distinguishes the comments.
 - 3. Feeding the rest of 12M comments into the model for labeling.
 - 4. Quantifying the percentage of comments that are labeled *1* for each cryptocurrency.

What Drives the Covariation of Cryptocurrency Returns?

Hypotheses and Data		Endogeneity 00000000	Network Effect	Conclusion

Conclusion

This paper documents a strong comovement structure in cryptocurrency returns and the amplifying effect of network externalities.

- 1. Cryptocurrencies that have similar investor bases comove substantially more than currencies with different investors.
 - a) Cryptocurrencies with one standard deviation higher "connectivity" exhibit approximately 0.2 standard deviations higher correlations.
 - b) This effect cannot be explained by similarities in technological features or other characteristics.
 - c) Exogenous changes in the investor base cause significant changes in comovement.
 - d) The effect increases in time-horizon and leads to a strong cross-predictability.
- 2. The network effect plays an important role in explaining the magnitude of the results.
